## MÉTALLERIE

trou de 12 mm agrandi à la lime -

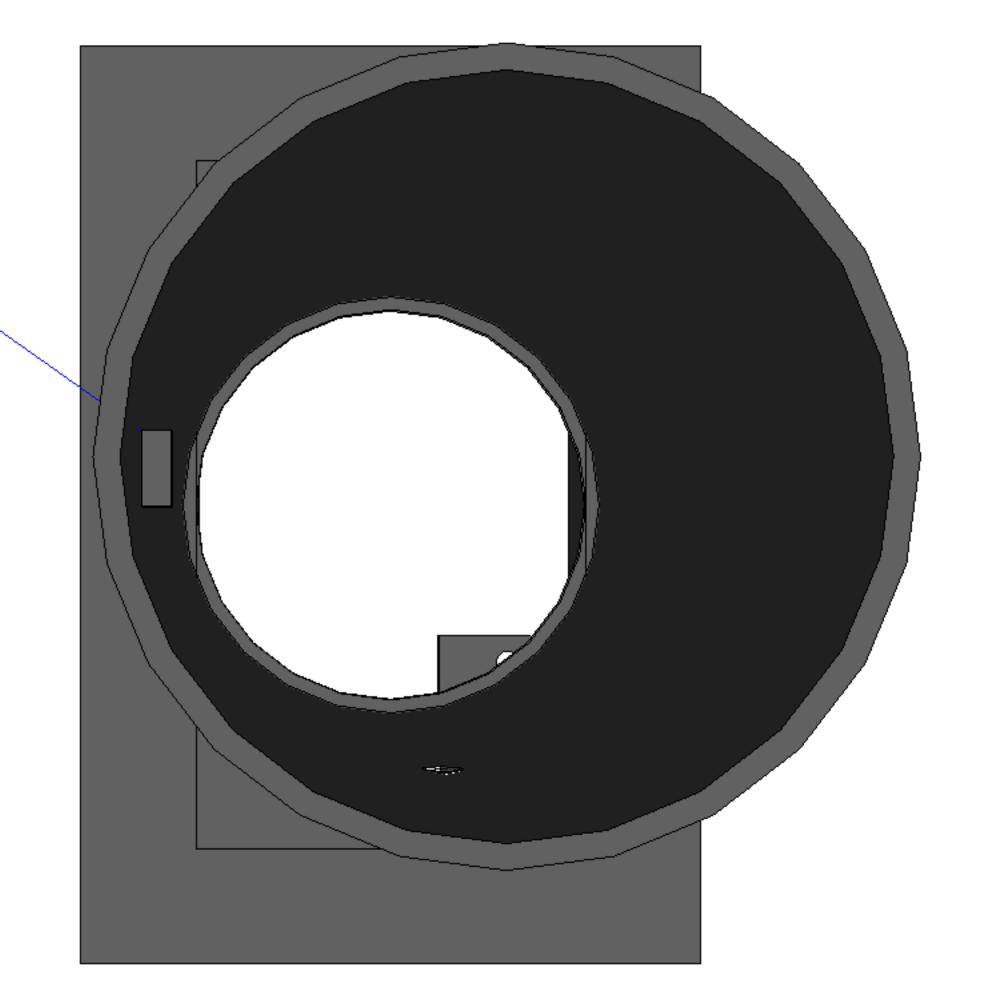

Il n'y a qu'un seul trou pour le clapet d'obstruction

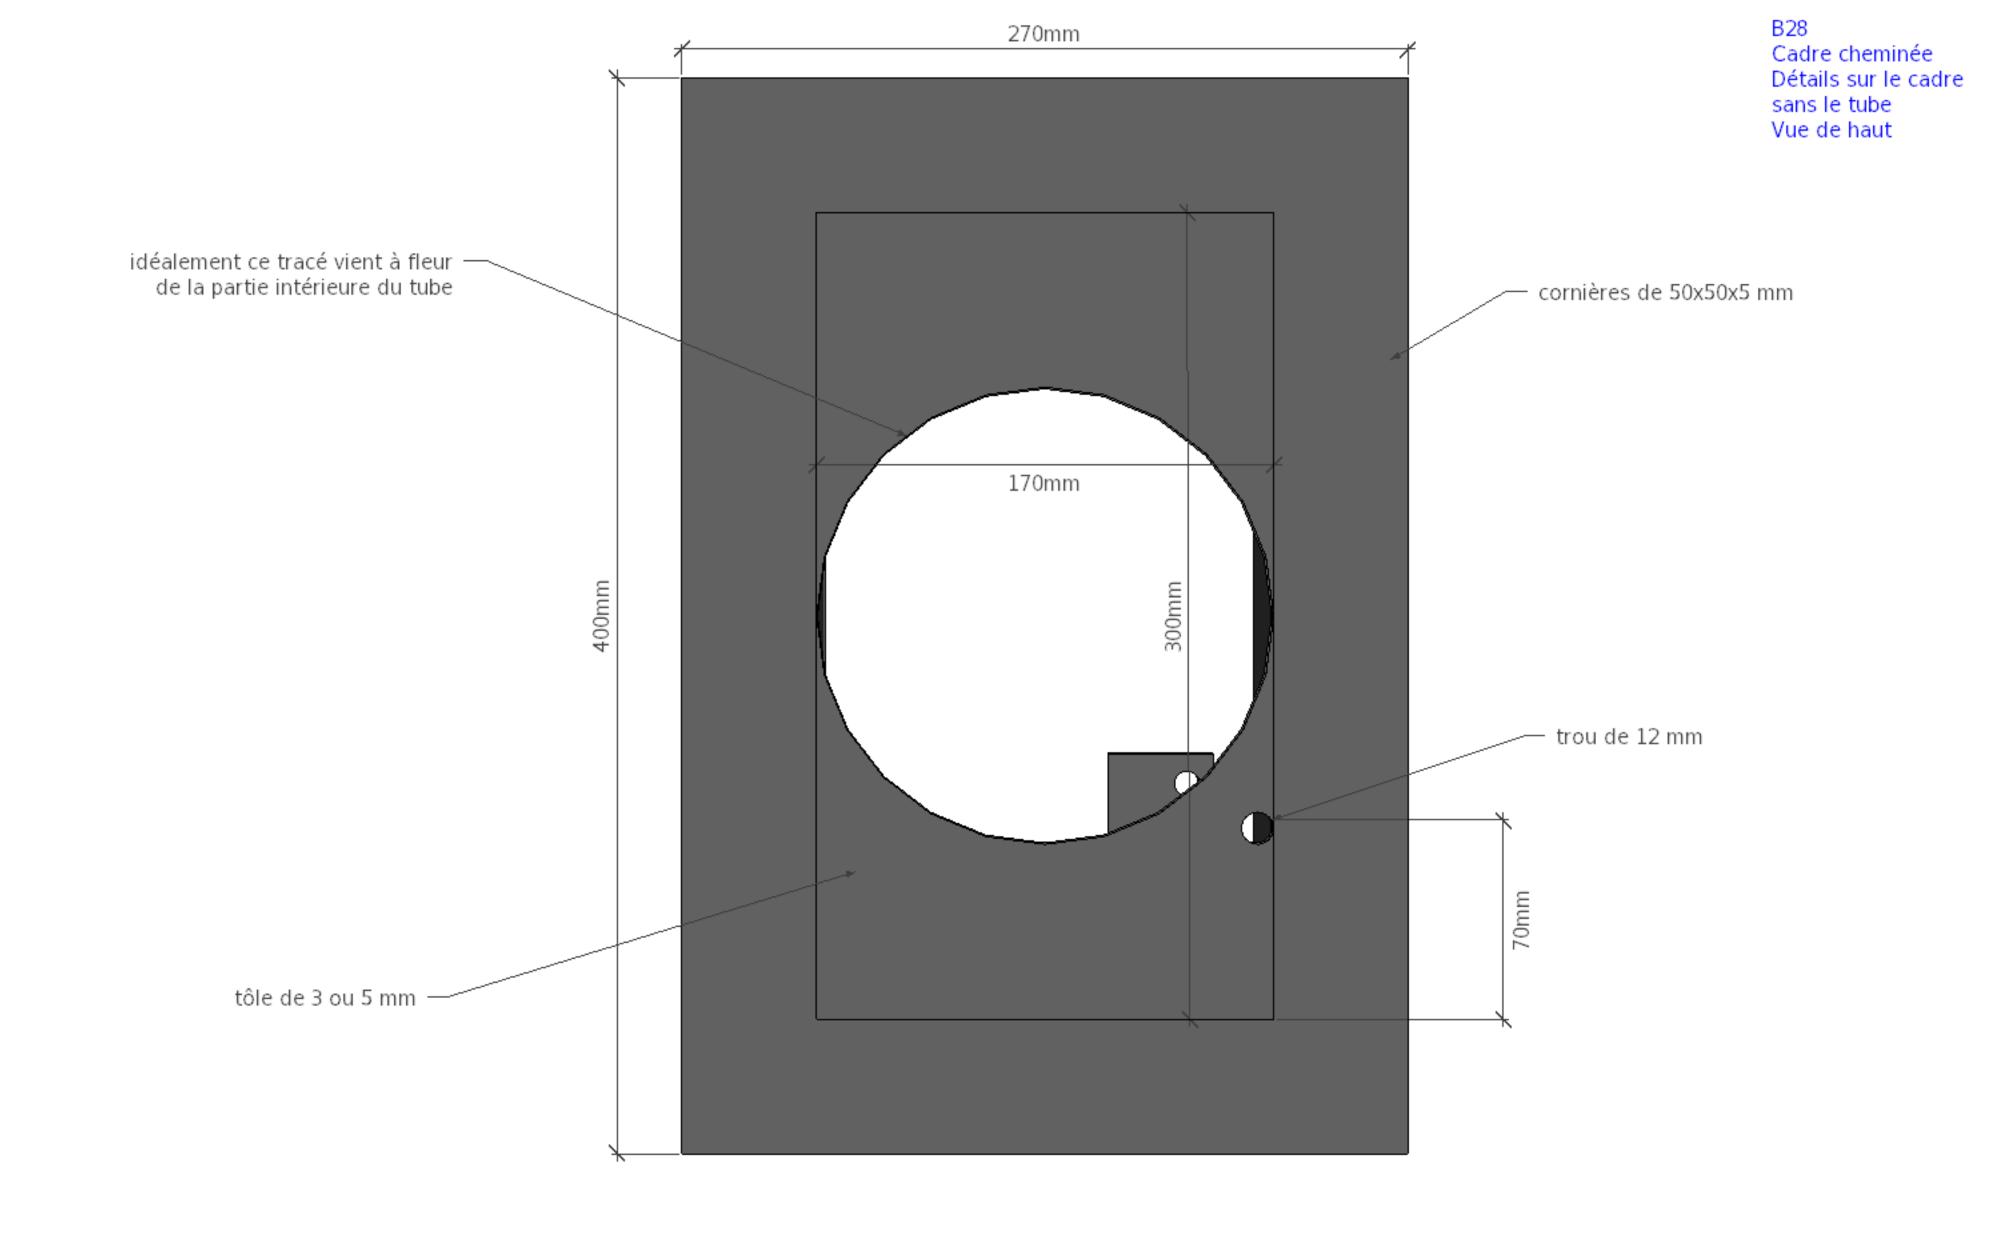

Le trou doit être percé le long de la ligne de soudure du tube

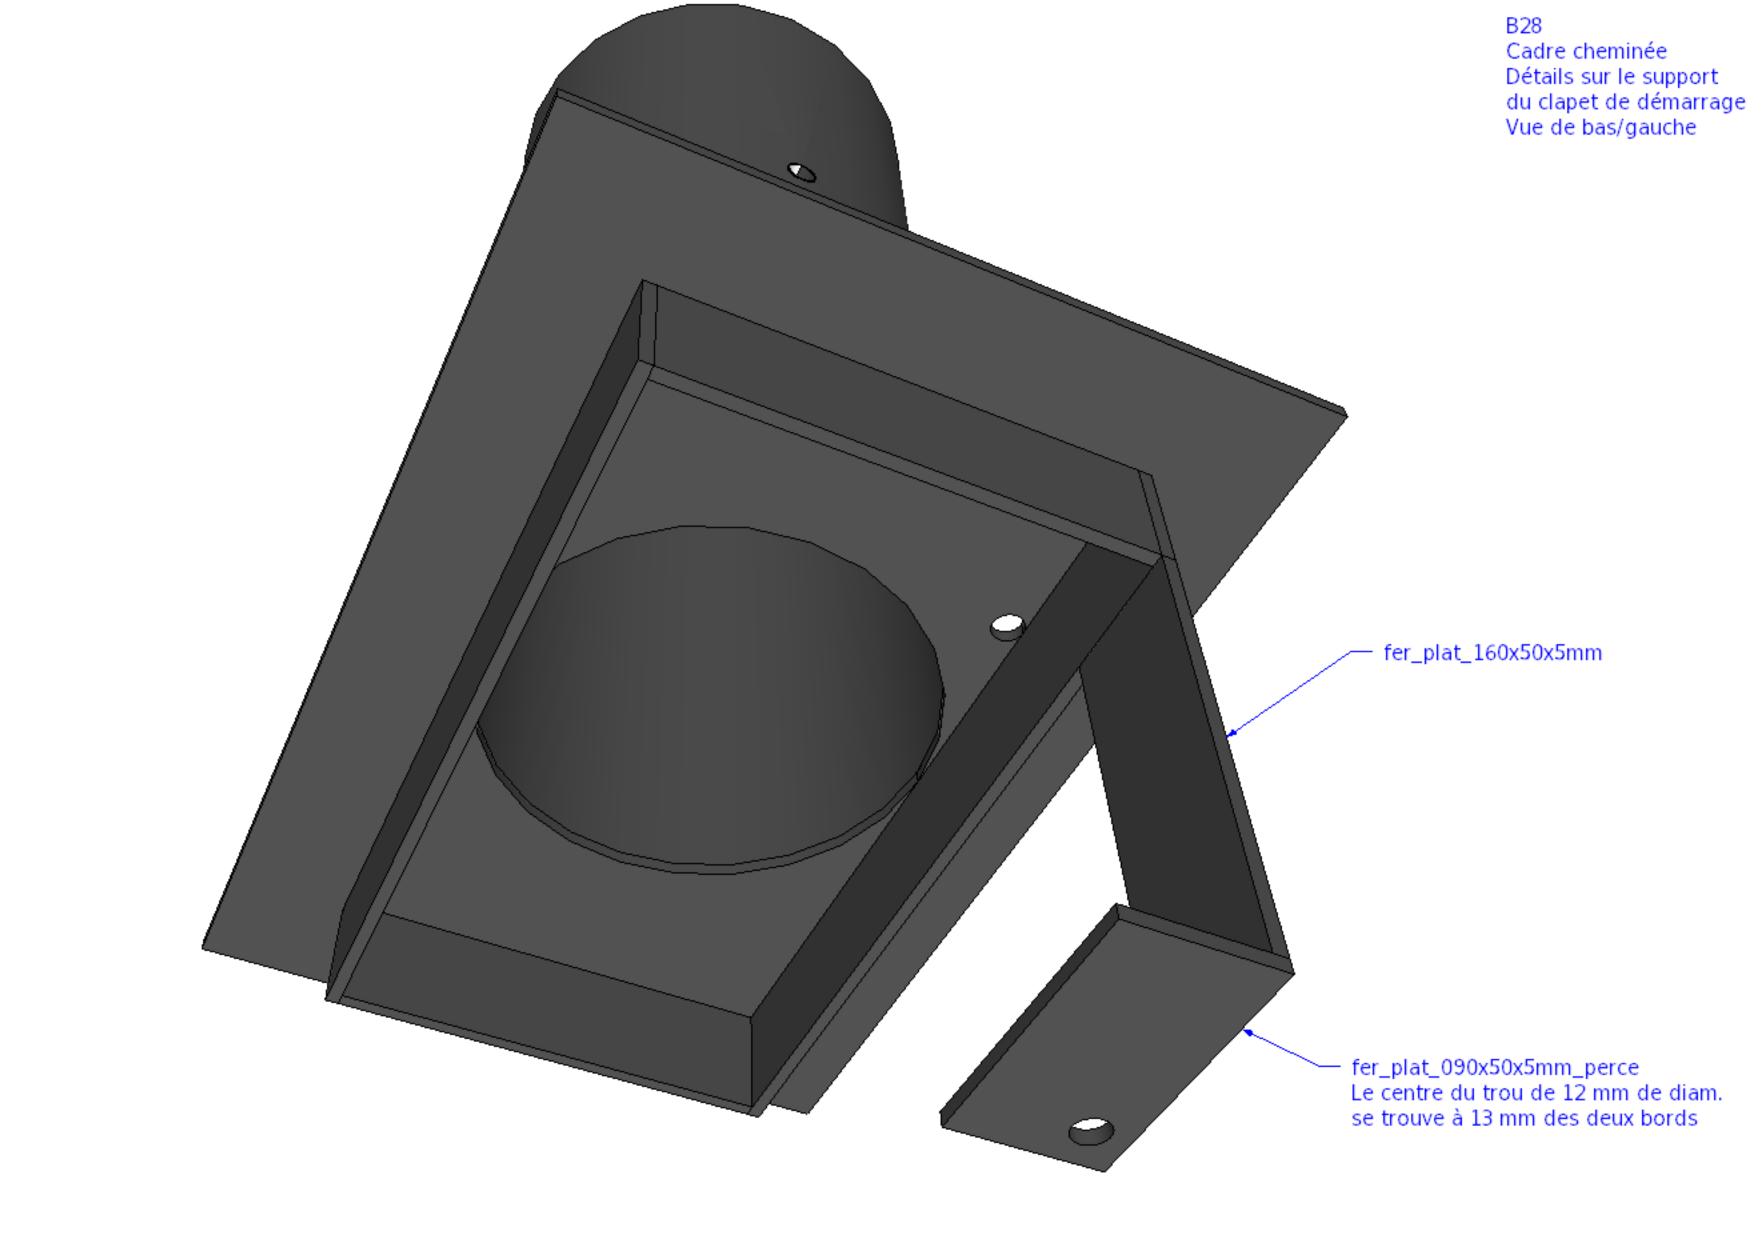

Ce tube est difficile à trouver. On trouve généralement du tube de 193.7x4 mm (185.7 mm int.) et dans ce cas il faut souder une butée à l'intérieur du tube et faire l'étanchéité avec du joint de porte plat de 10x2 mm Butée fer\_carre\_8mmx20mm Soudée à 60 mm du bord haut du tube

La butée n'est nécessaire que pour le tube de 193.7x4 mm. Pour le tube de 193,7x6.3 mm, l'emboitement est parfait.

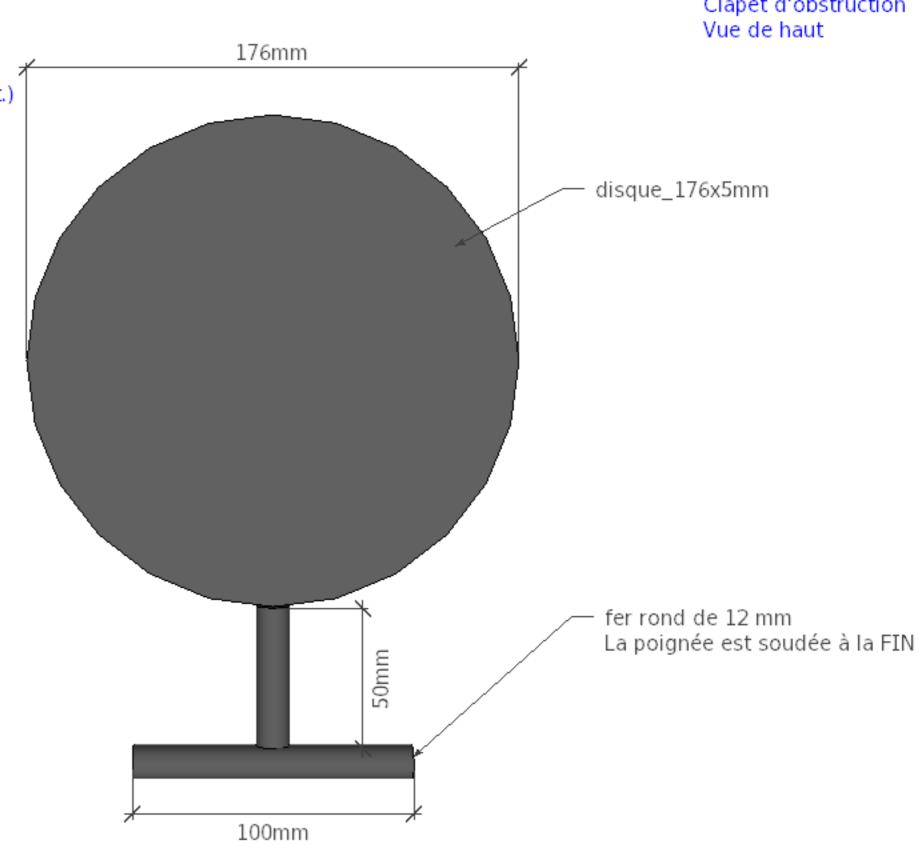

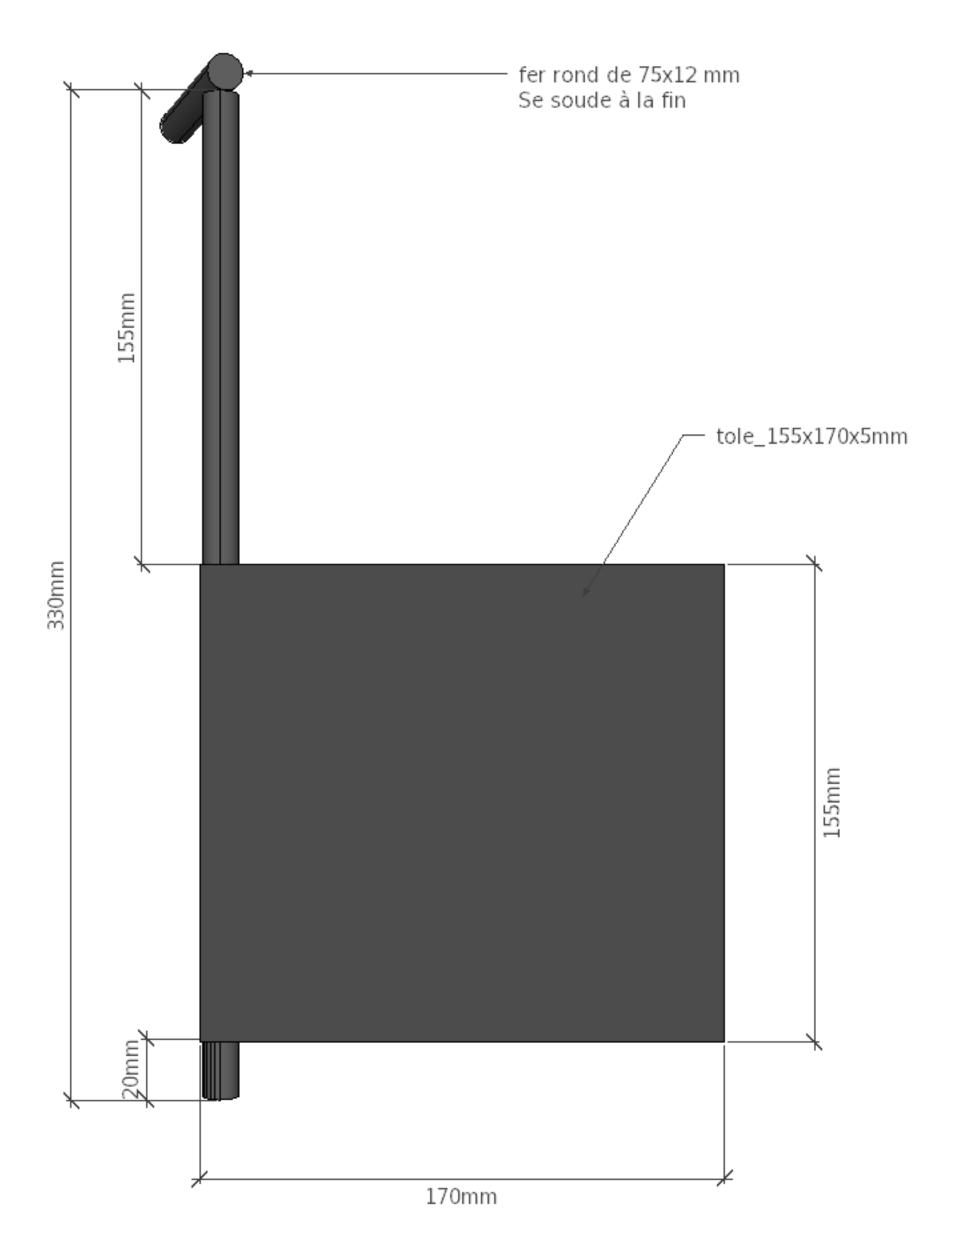

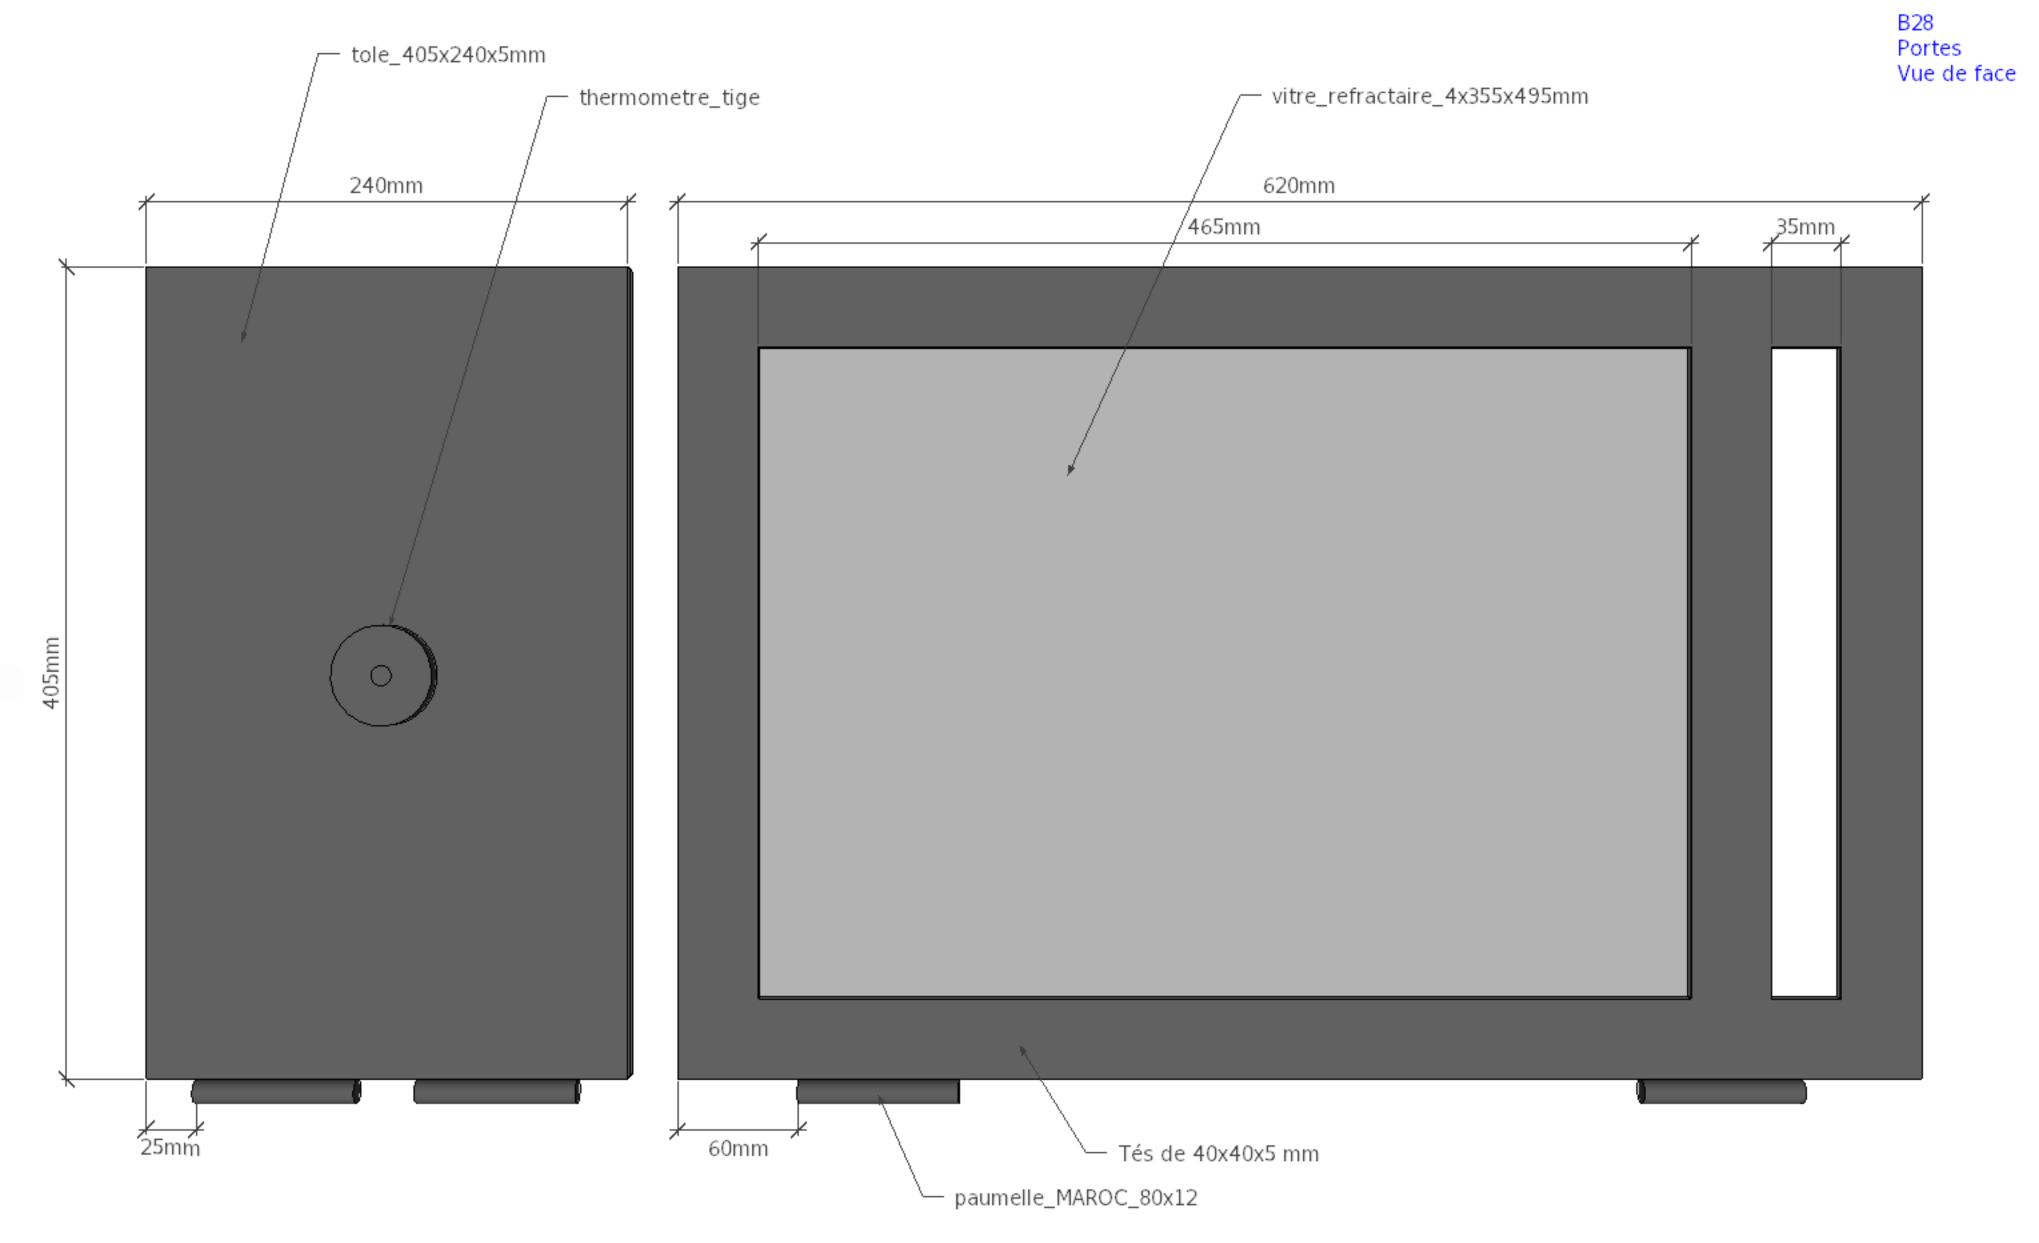

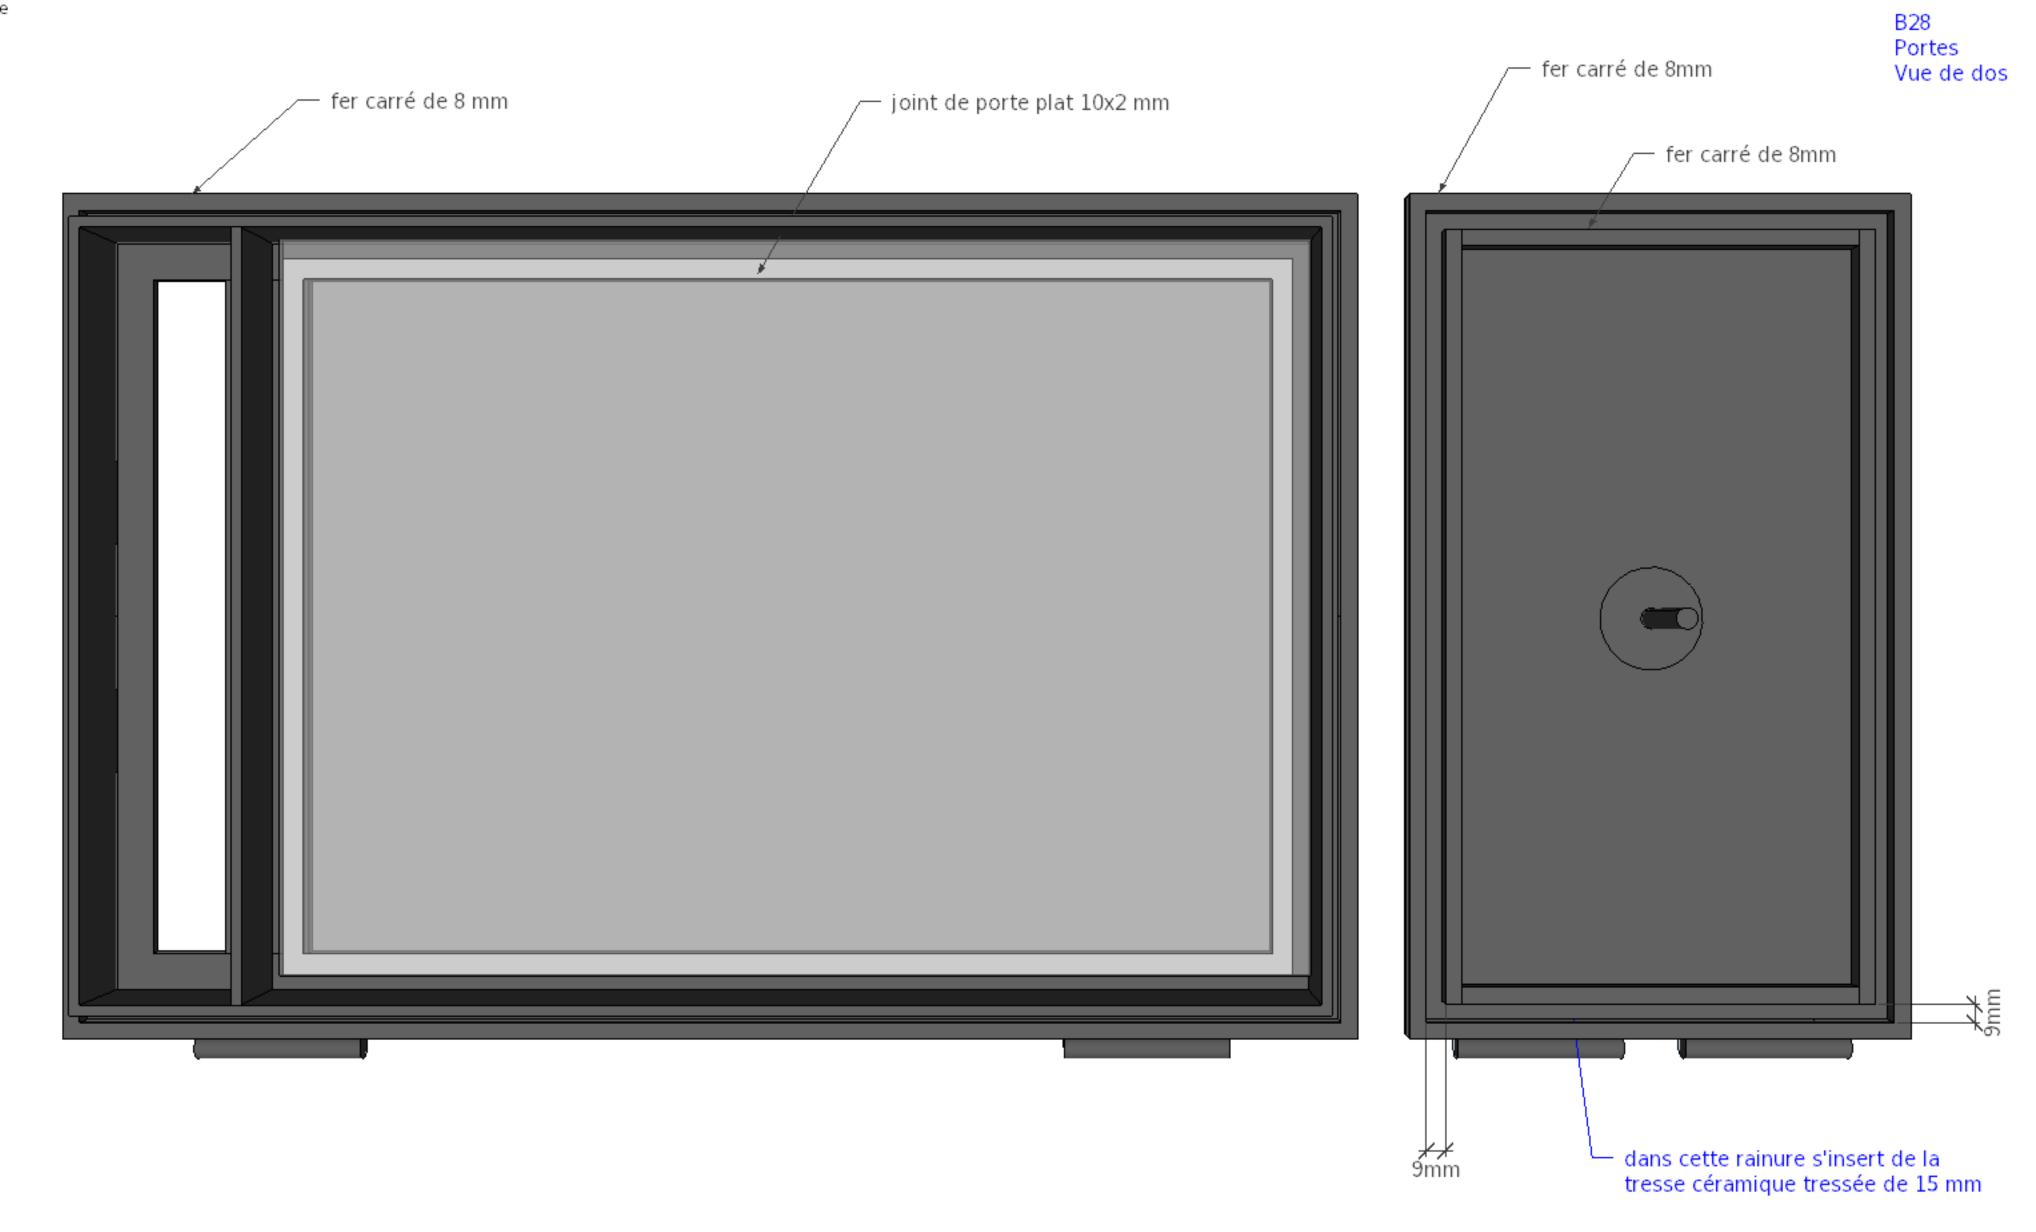

La surface de ce disque mesure 5% de moins que la section interne du tube de 193,7x6,3 mm (181,1 mm int.)

Pour un tube de 193,7x4 mm (185,7 mm int.), le diamètre idéal de ce disque serait de 180 mm

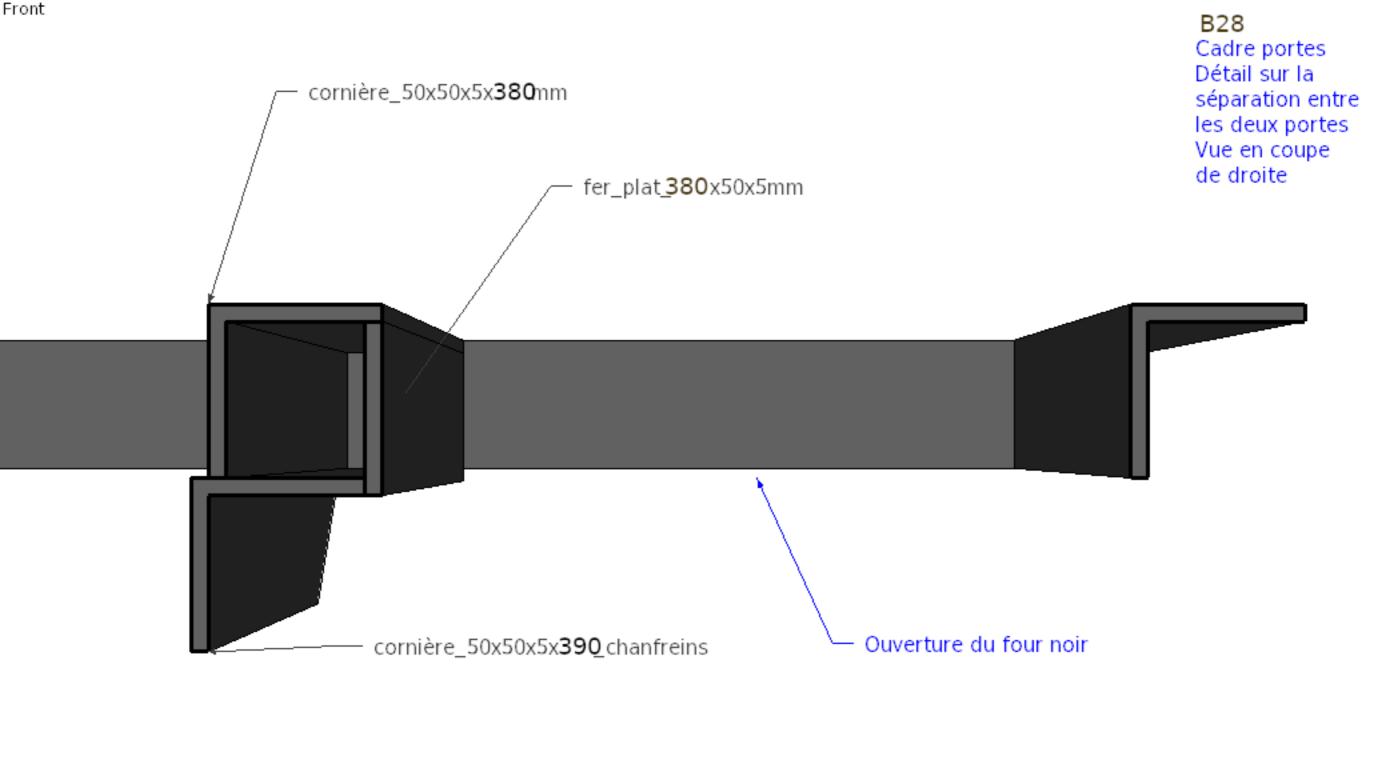

960mm

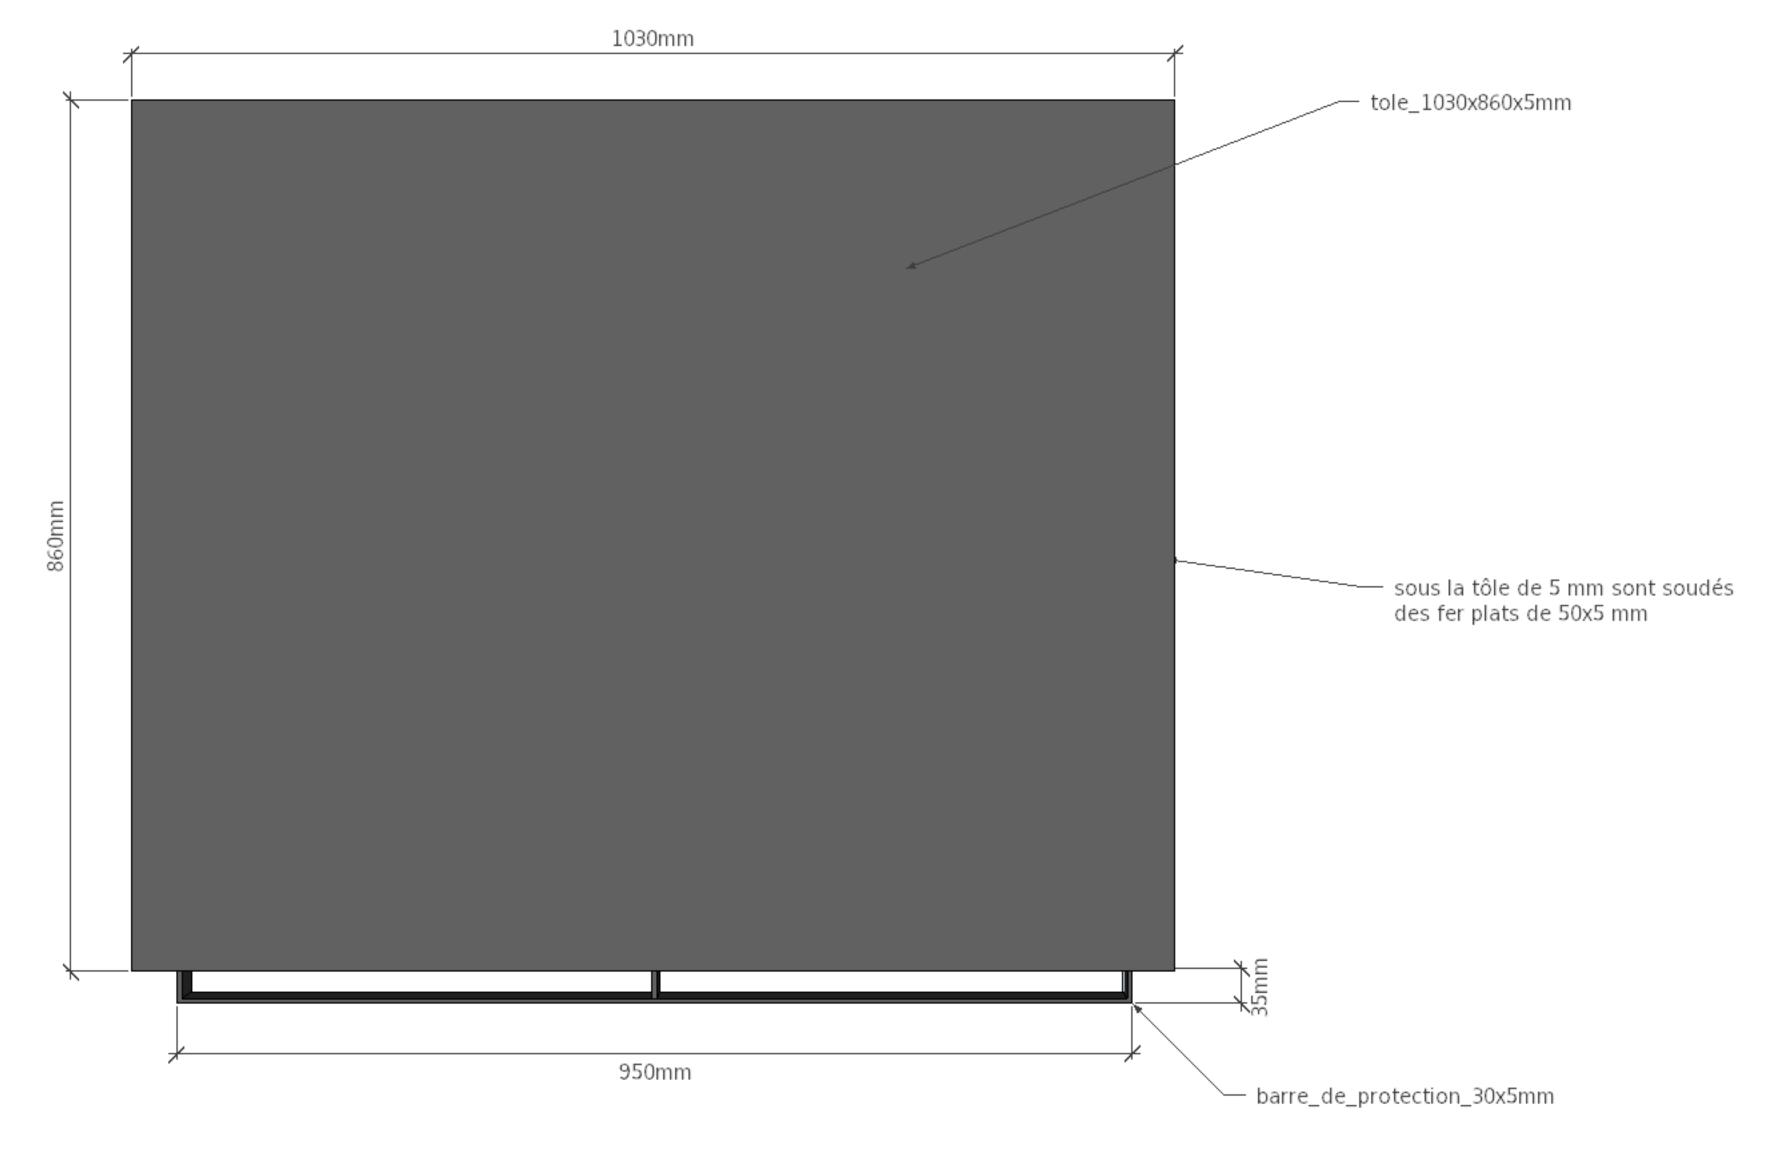

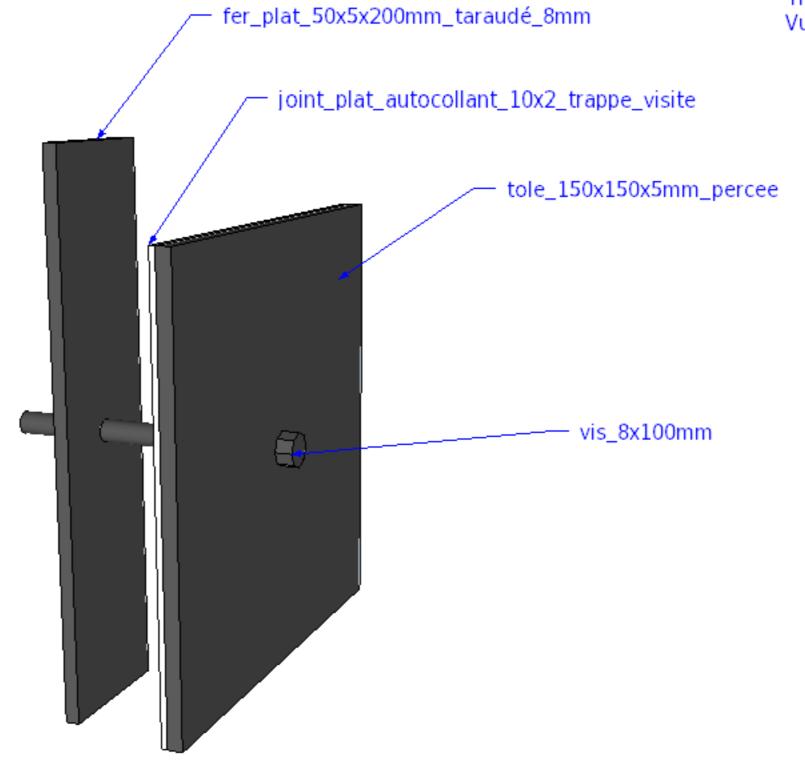

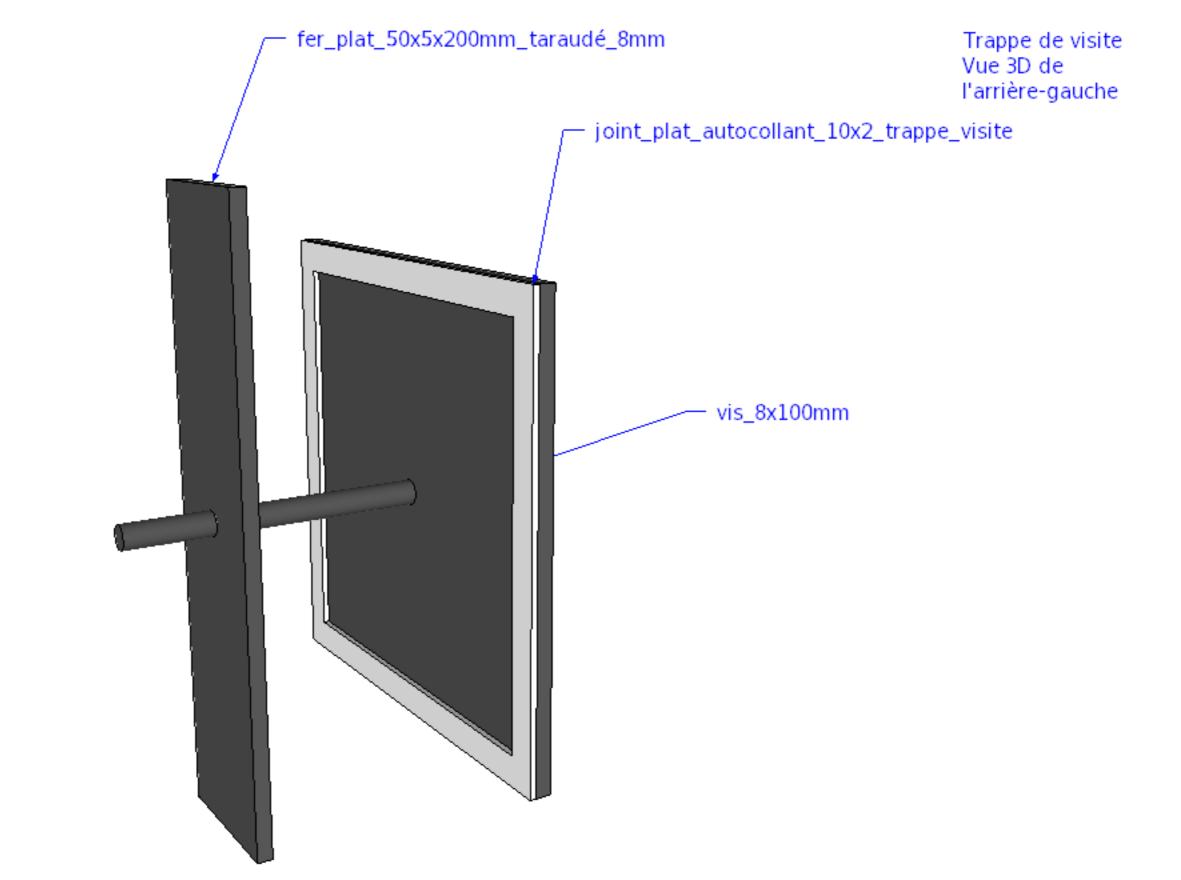

Les 4 fixations sont identiques

Le cadre est vissé avec des vis M6 à tête fraisées de 70 mm

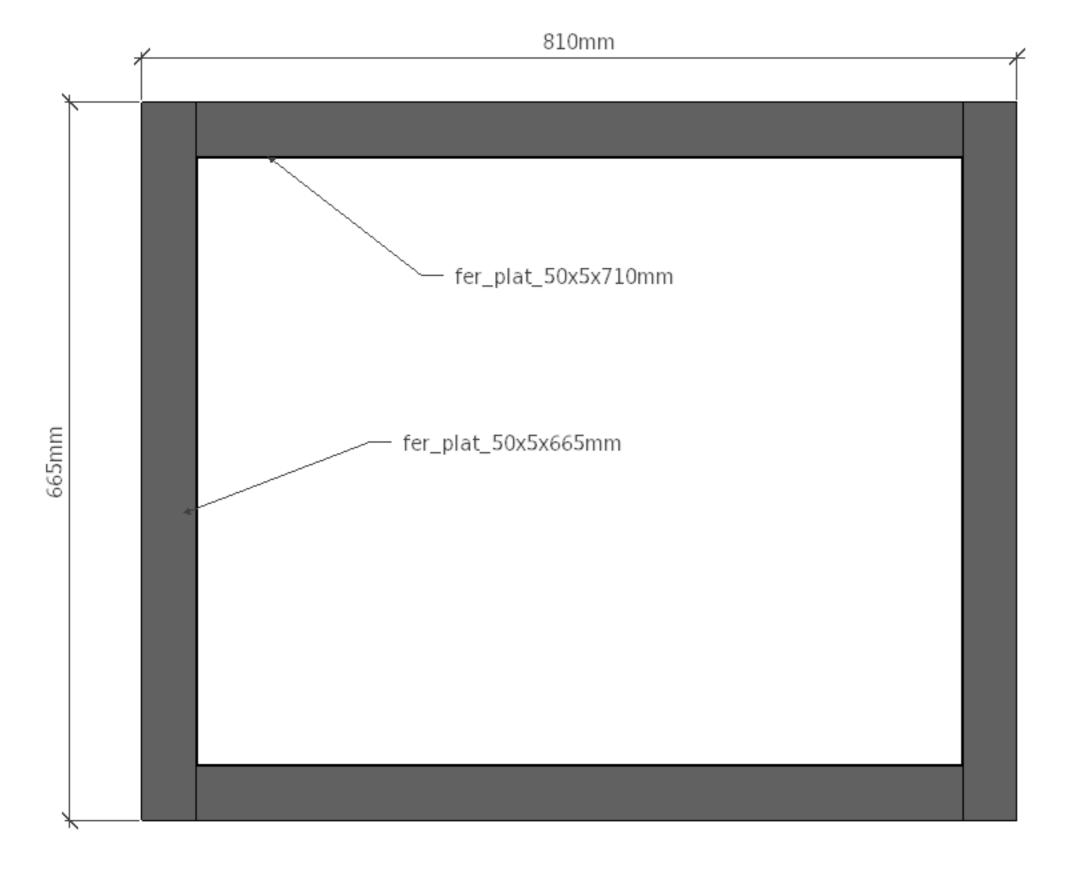

Les fixations sont placées entre les deux peaux, de sorte que le cadre est maintenu par COMPRESSION

Тор
